

# Modulation Classification with FPGA

Brenda So, Cory Nezin

Advisor: Professor Toby Cumberbatch

# Neural Network Explosion

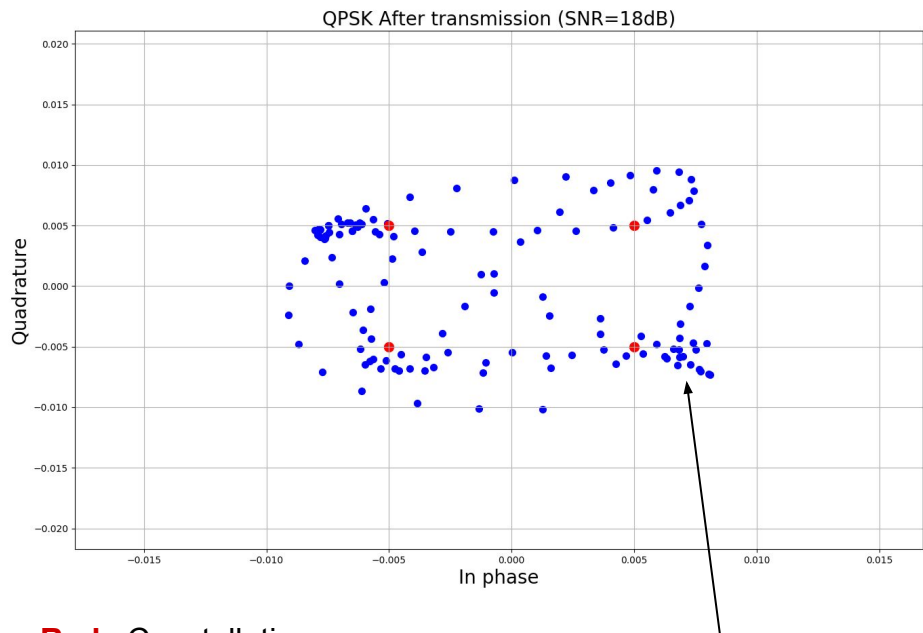

Advancements in GPUs led to popularity of **convolutional neural networks (CNNs)**

CNNs are found to supercede human and traditional machine learning performance

Recent research expand to areas such as communication networks

# Goal : Classify modulation with raw IQ samples on FPGA

**Red** : Constellation  
**Blue** : Transmitted signal

Signal corrupted by  
channel effects!

Current modulation classification is done with either **likelihood based methods** or **feature based methods**

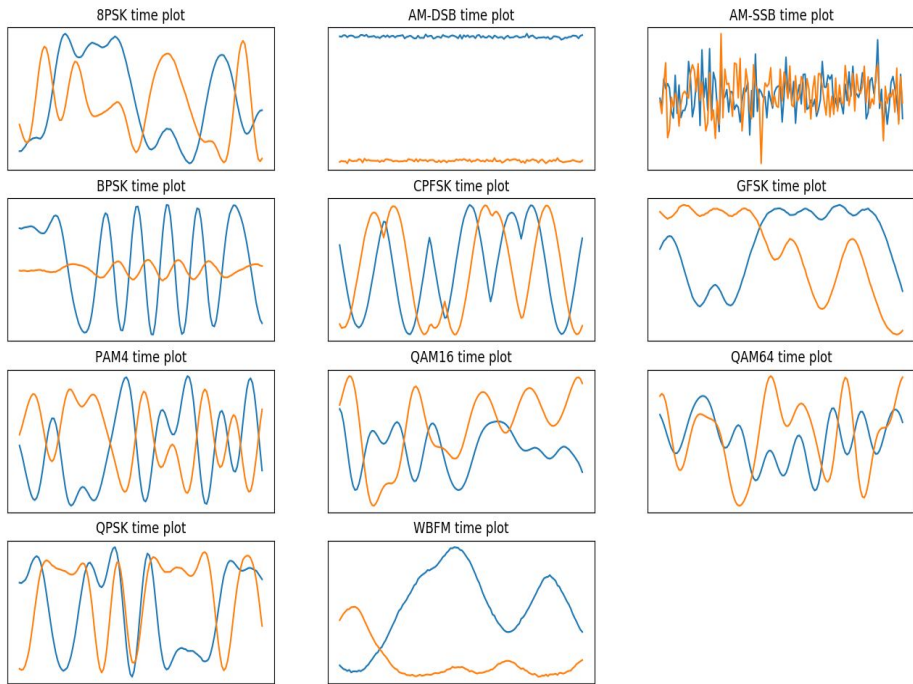

- 1) High computation complexity
- 2) Requires a lot of expertise

Current research focus on CNN architecture design

Test CNN physically with FPGA

- Benefits : low latency and power
- Challenge : Limited resources!

# Radio Signal Dataset

Time Series Samples from **radioML** dataset

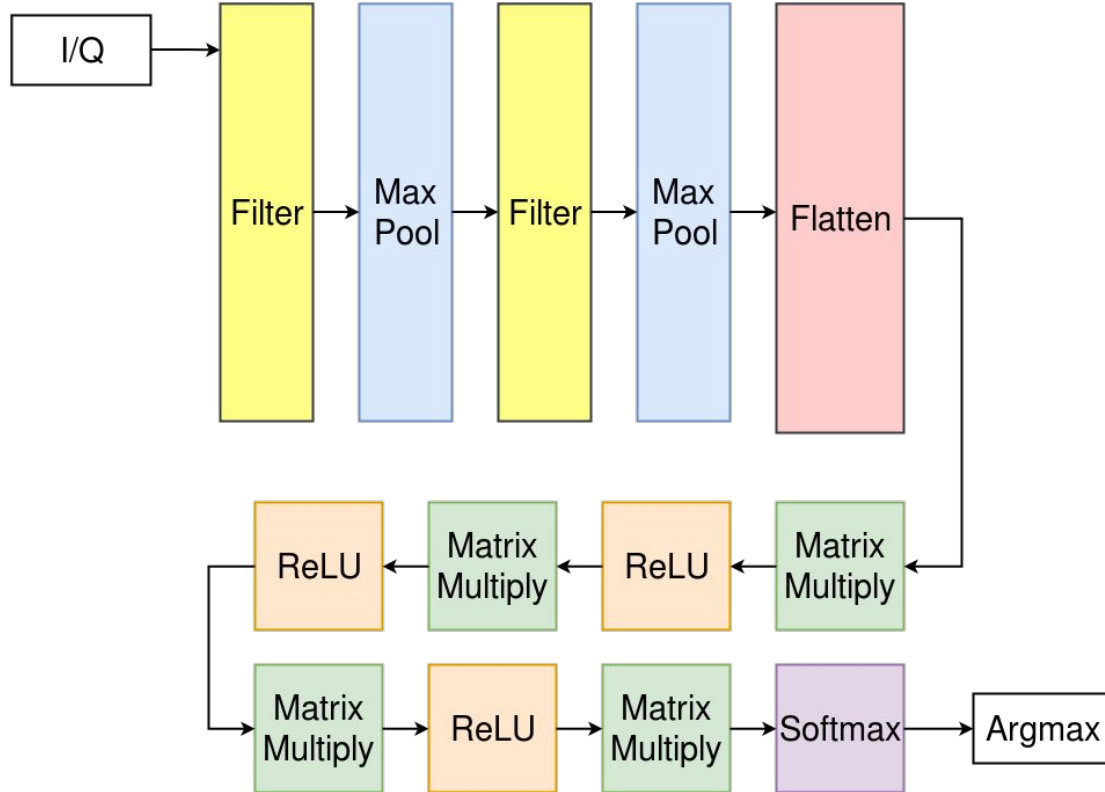

**radioML** is a simulated radio dataset

Takes into account of channel effects  
and a range of SNR

Includes 8 digital and 3 analog  
modulation schemes

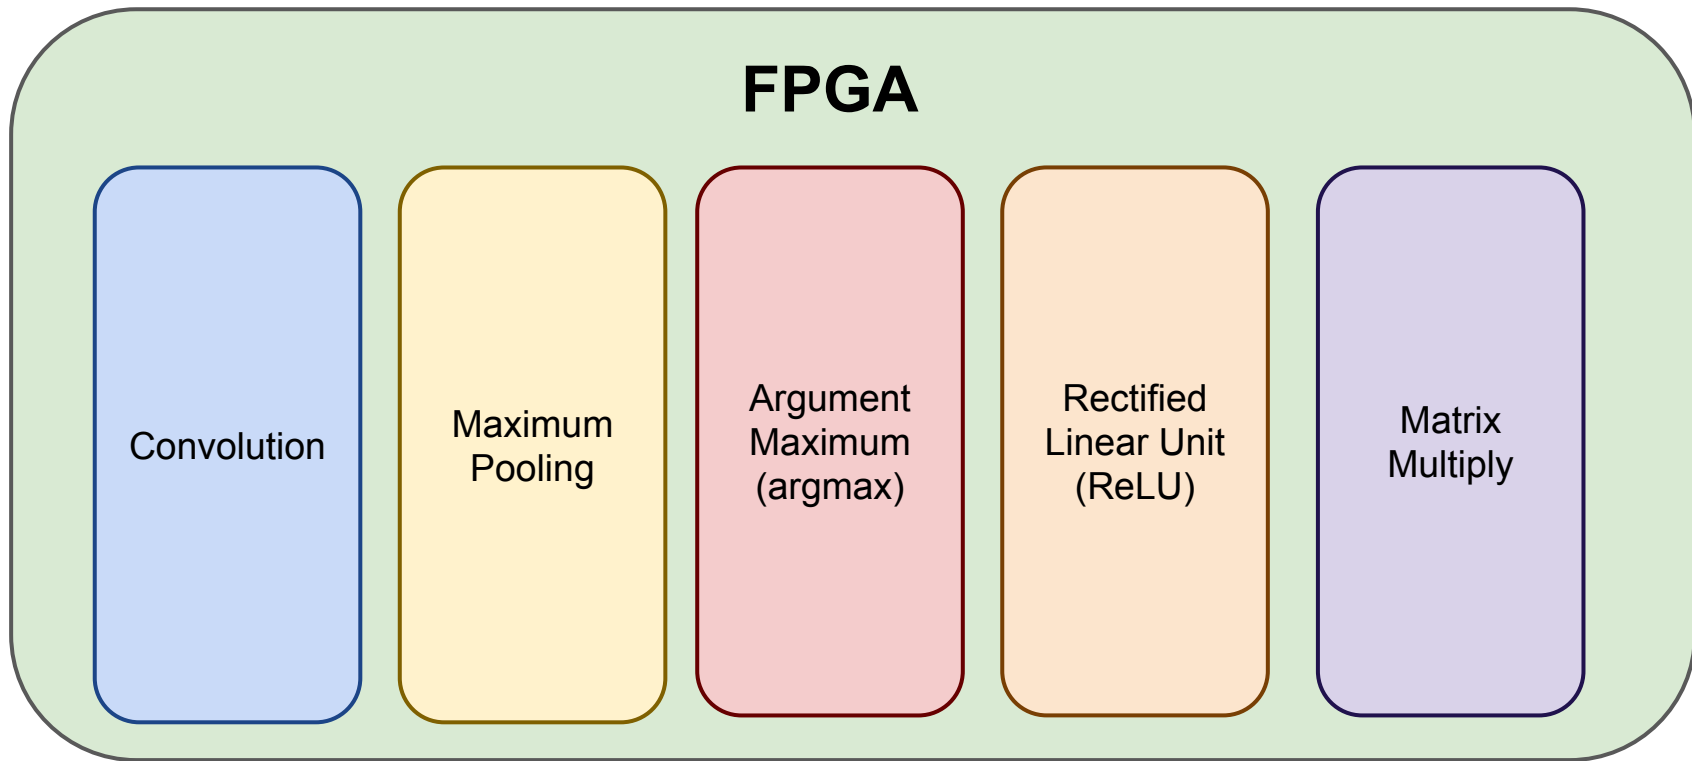

A total of 220k segments of 128  
complex-valued baseband IQ samples

# CNN Architecture

Requires ~0.5M MAC operations per inference.

# Building basic blocks for CNN

# Rectified Linear Unit (ReLU)

ReLU Graph

ReLU  
Functional Unit

**ReLU** introduces **non-linearity** to the model

Easily implemented with a Mux

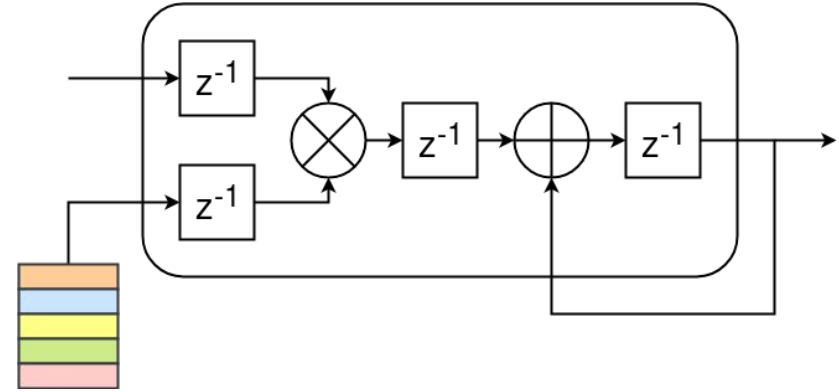

For a 2's complement binary number, the **MSB** indicates whether the number is negative or not!

# Matrix Multiplication / Inner Product Architecture

Naive

Pipelined

Less resource intensive.  
Shorter critical path.

# Simulation

Simulated a FIFO reading from ROM to emulate radio module

# Designing a Radio Playground

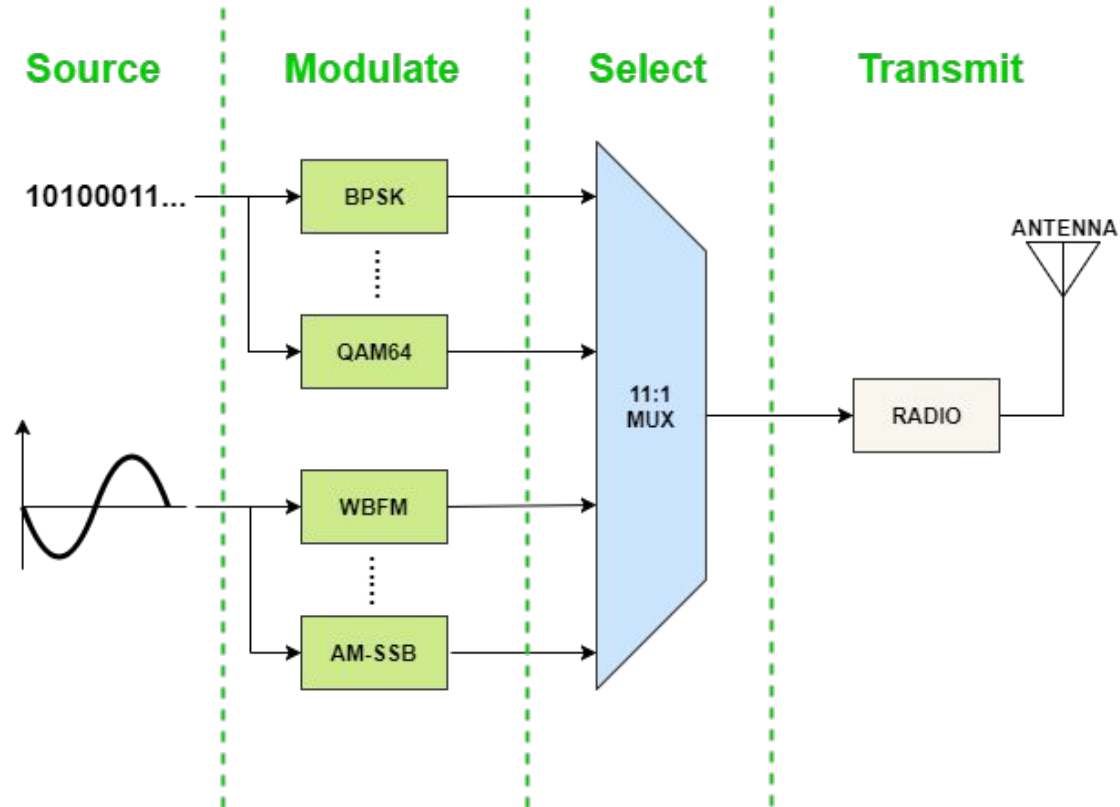

We want to be able to...

- 1) Send modulated signals
- 2) Choose modulation
- 3) Adjust noise level added to signal

**Solution : Transmit signals with a software defined radio (SDR)!**

# Physical System Block Diagram

Select  
Modulation  
Scheme

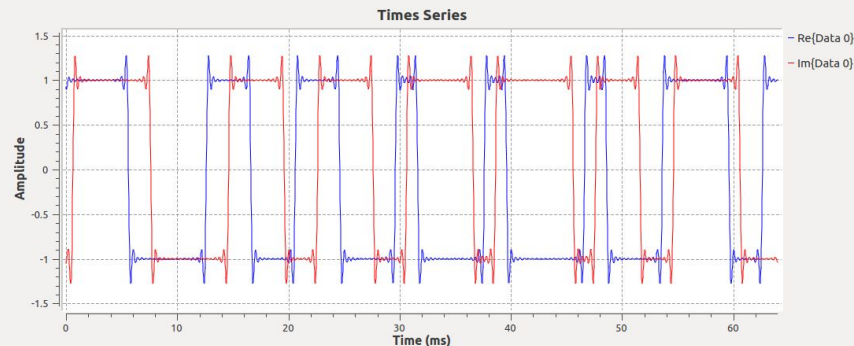

mod\_select: QPSK

☐ Noise Enable

Add noise  
to signal

Control Noise

Noise Amplitude  5.06000

# End of Semester Goals

**Wireless  
System Setup**

**FPGA  
Implementation**

**CNN  
Implementation**

**Thank You!**  
**Any Questions?**
